

Cloud computing

Antonio Corradi

DEIS, University of Bologna, ITALY
antonio.corradi@unibo.it

What is cloud computing?

*“The architecture and terminology of cloud computing is as clearly and precisely **defined as, well, a cloud.**”*

Source:
www.opencloudmanifesto.org

Cloud Computing Problem Space

“It starts with the premise that the **data services and architecture** should be on **servers**. We call it **cloud computing** – they should be in a ‘cloud’ somewhere. And that if you have the right kind of **browser** or the right kind of access, it doesn’t matter whether you have a PC or a Mac or a mobile phone or a BlackBerry or what have you – or new devices still to be developed – you can get access to the cloud...”

Dr. Eric Schmidt, Google CEO, August 2006

Explosion of data intensive applications on the Internet

Fast growth of connected mobile devices

The Cloud data center

SkYROCKETING costs of power, space, maintenance, etc.

Advances in multi-core computer architecture

Cloud Concepts

- IT **on demand** pricing
- Best benefits in a **reliable** context
- Pool of **virtualized** computer resources
- Rapid live **provisioning** while demanding
- Systems on **scaling** architecture

Cloud keywords

**on demand,
reliability,
virtualization,
provisioning,
scalability**

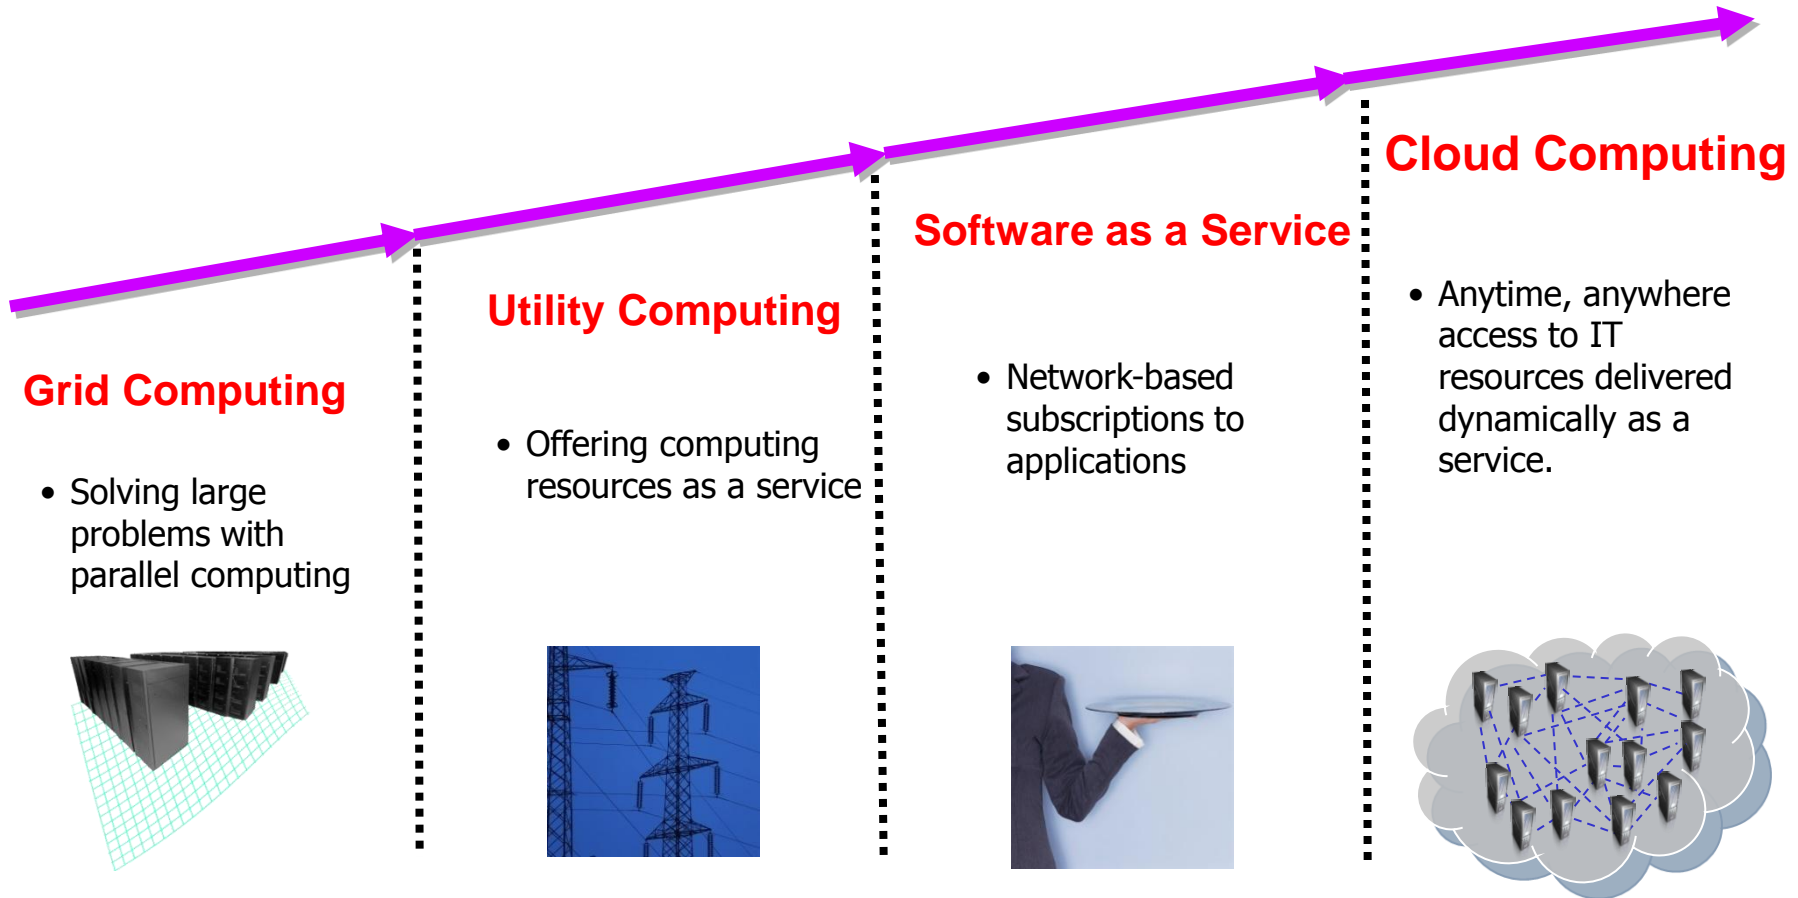

What is a Cloud

One Cloud is capable of **providing IT resources 'as a service'**

One Cloud is an **IT service** delivered to users that have:

- a **user interface** that makes the infrastructure underlying the service transparent to the user
- reduced **incremental management costs** when additional IT resources are added
- **services oriented management** architecture
- **massive scalability**

A bit of history

Before Cloud computing: GRID

▪ Grid computing

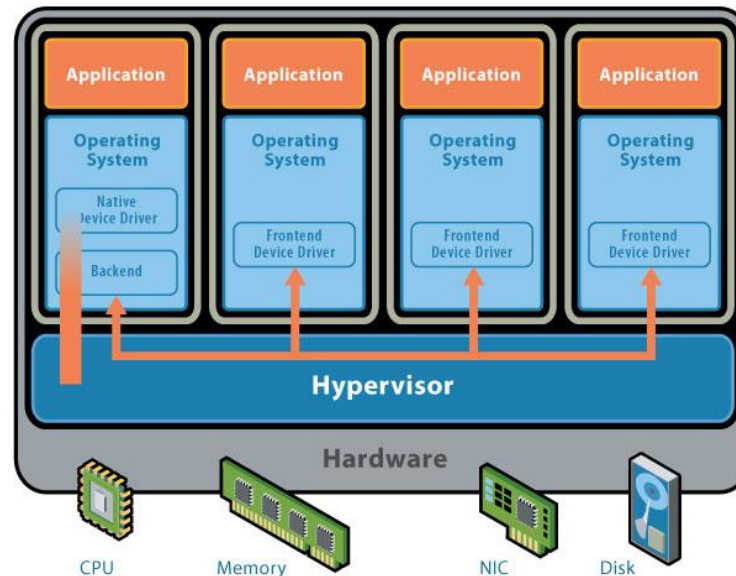

- Sharing of **heterogeneous resources** (computer, software, data, memory, computational power,, ...) in **highly distributed environments** with the goal of **creating a virtual organization scalable** (*by need!*)
- Interfaces (for management), often **too fine grained, with low level of abstraction, and non self-contained** ☹
- Application areas very **limited and specific** (parallel computation for scientific, engineering scenarios, ...)

Before the Cloud: Virtualization

▪ Virtualization

- Technologies for **virtualization** (either system-based or hosted), as in a server farm: Vmware, Xen, ...
- **Isolation & personalized infrastructure and/or SW platform** (O.S. and some additional applications)
- Tool for the **efficient management** of computing infrastructures (IBM Tivoli suite, Xen monitoring tools, ...)

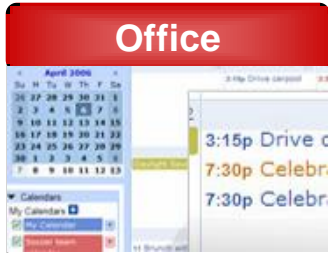

Before Cloud computing: Web 2.0

■ Web 2.0

- Usage of asynchronous protocols not visible to users to ask only really required info and not the whole web pages: **Asynchronous Javascript And XML (AJAX)**
- New ways of **using Web services coupled with new applications easier to use, collaboration based and openly available, without requiring any installation** by interested users: new business model, **very, very cooperative** (Software as a Service ☺)

And several others...

Before Cloud computing: Utility computing

- Huge computational and storage capabilities available from **utilities**, the same as for energy and electricity, and on pay-per-use base.
- **“Computing may someday be organized as a public utility”** - John McCarthy, MIT Centennial in 1961
- **Metered billing** (pay for what you use)
- **Simple to use interface** to access the capability (e.g., plugging into an outlet)

Software as a Service (SaaS)

Traditional Software

Build Your Own

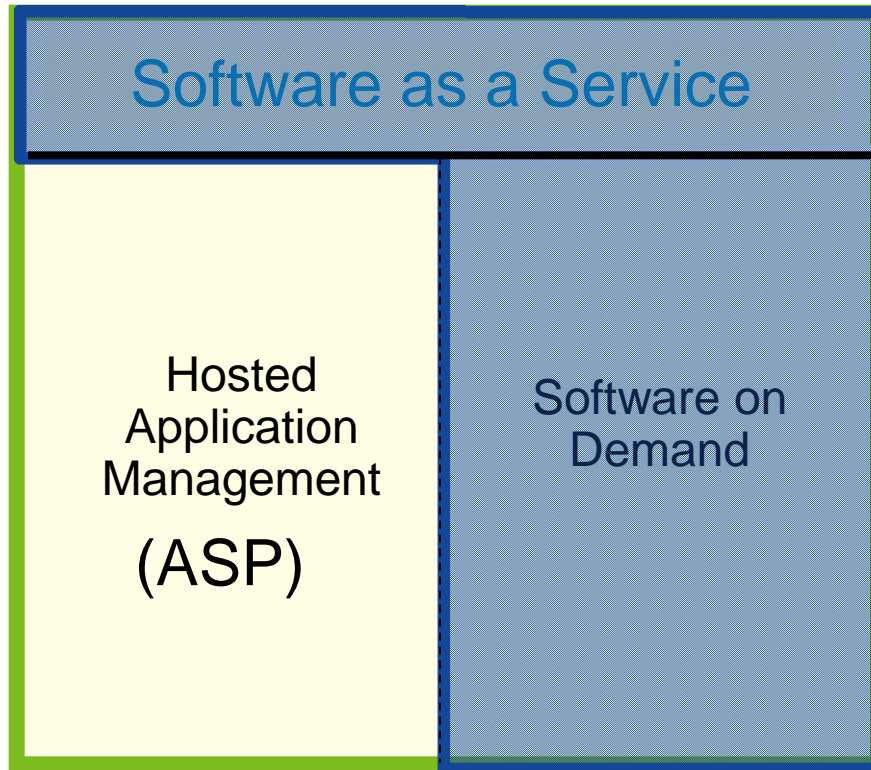

On-Demand Utility

**Plug In, Subscribe
Pay-per-Use**

Software as a Service (SaaS)

- Built for one-to-one delivery or management
- Applications deployed in-house
- Dedicated infrastructure/environments
- Highly customized
- One-time license and recurring maintenance or support fee

- Built for one-to-many delivery over Web
- Applications not deployed in-house
- Shared public infrastructure
- Little customization
- Subscription fee or advertising-supported

Hidden Cost of IT

Avoid the hidden costs of traditional CRM software

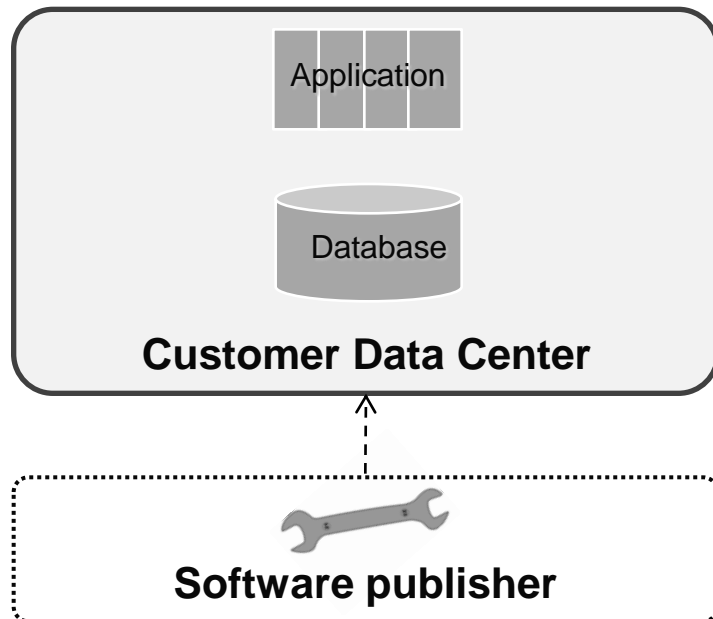

SaaS - Software as a Service

- **Software ownership costs pushed to vendor** - hardware, software, system security, disaster recovery, maintenance, monitoring
- **Return to core competency** - organizations shift resources to core competencies, vendors focus on managing their SaaS
- **More efficient deployment** - instant evaluation, more collaboration between vendor and IT organization, much faster deployments
- **Eliminate shelfware & maintenance** - pay for what you use
- **Always on current version** - version-free software means the latest for the customer
- **Modern, Web 2.0 interface** - drive technician usage and better customer interaction with IT
- **SaaS homogeneity costs less** - one version for the vendor to support means lower costs for everybody

Applicazioni areas suitable for SaaS

- **ERP vertical business** applications, both specialized and very specific
- **General-purpose** applications without any adaptation (potentially sharable)
 - self-service provisioning and ad-hoc personalization
 - applications available to several different users
- **Business B2B** applications **domain specific**
 - no need of third party hosting and involvement
- **Customer/Supplier** applications
 - applications where most of users and access is externally to the organization and where ubiquitous access via Web is critical and intrinsic
- **Business** applications **even critical**, but not the **core business ones**

Traditional on-premise Deployment at the client site

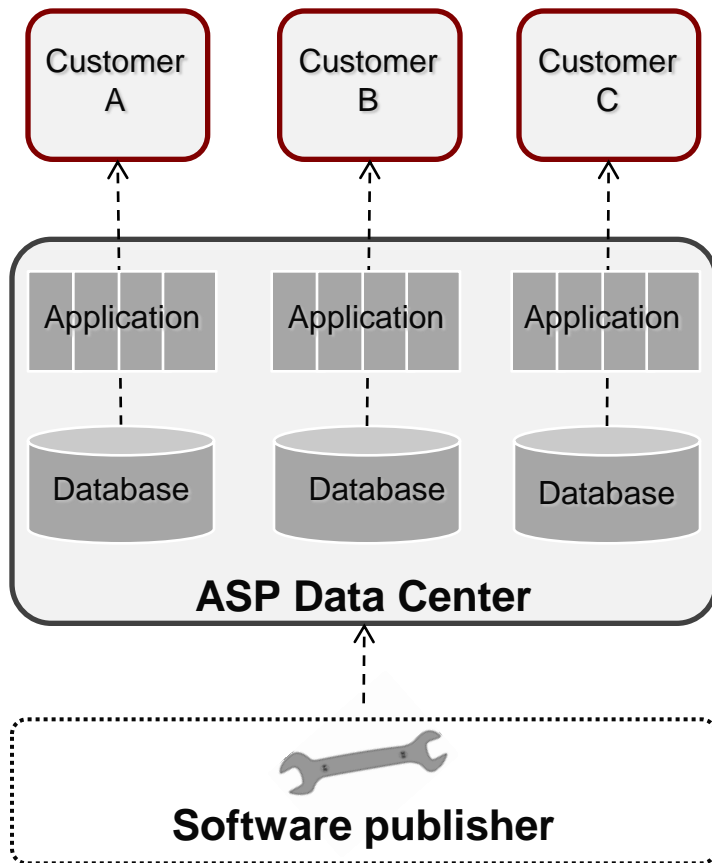

Details

- Full ownership
- Significant implementation
- Customizable
- Difficult to upgrade / maintain

Examples

- HP Service Manager
- BMC Remedy
- CA Service Desk
- EMC Infra

Application Service Provider (ASP)

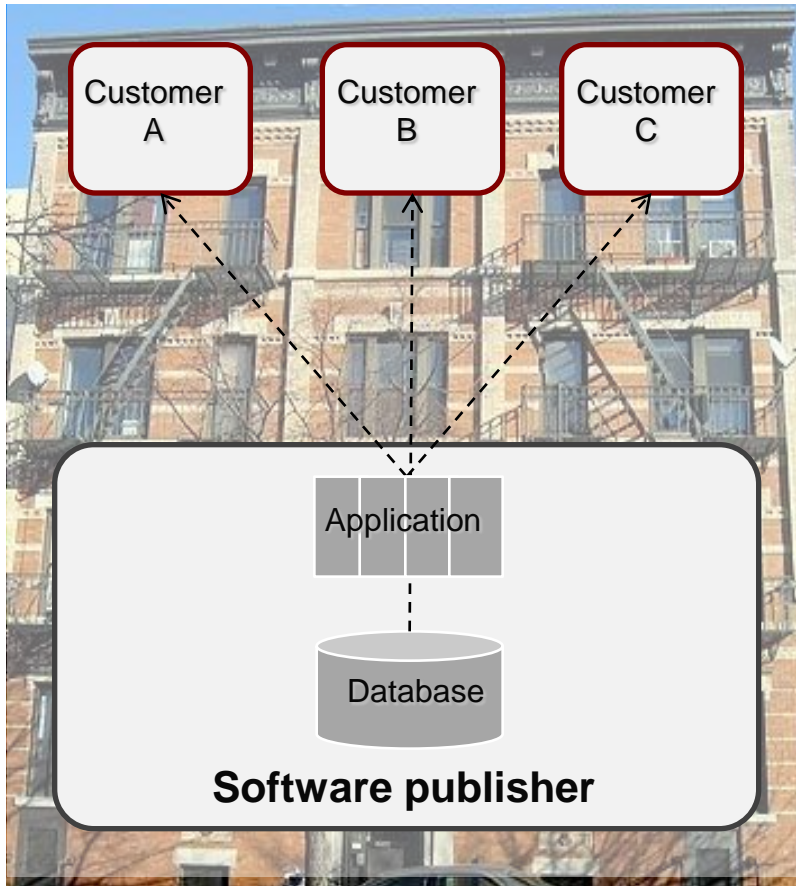

Details

- Procures app and resells service
- Broker between customer and publisher
- Focus on 'out-of-box'

Examples

- IBM GS
- HP Services
- BMC AAS
- CSC

SaaS multi-tenant

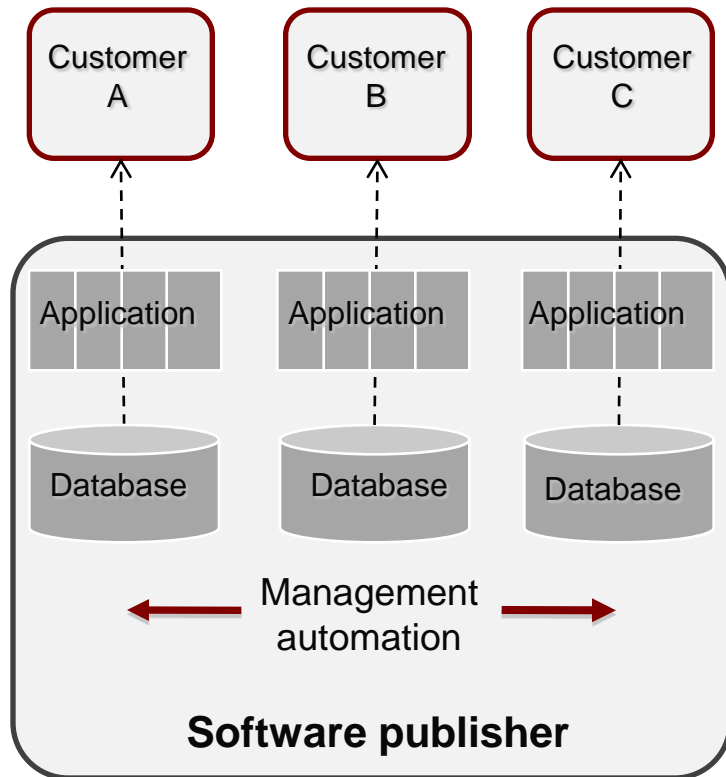

Details

- Hosted by software publisher
- Many customers to one application set
- Thought to be inflexible

Examples

- Salesforce.com
- Workday
- Innotas

SaaS single-tenant

Details

- Hosted by software publisher
- Customers receive their own app and database
- Auto-upgrades
- Extensive customization

Examples

- Service-now.com
- InteQ
- Eloqua

Modelli SaaS in evolution

Some increasing resources models for providing some resources as a service, XaaS

SaaS Software as a Service

- Resources are simple **applications available** via remote Web access

PaaS Platform as a Service

- Resources are **whole software platforms available** for remote execution, i.e., several programs capable of interacting with each other

IaaS Infrastructure as a Service

- Resources are intended **in a wider and complete way, from hardware platforms, to operating systems, to support to final applications:** usually via virtualization up to **Cloud Computing**

Layered Architecture: IaaS, PaaS & SaaS

- Below the real architecture:
hardware components
&
software products

Layered Architecture: IaaS, PaaS & SaaS

- **Infrastructure:** layer to enable the distribution of Cloud services, typically realized by a virtualization platform

Layered Architecture: IaaS, PaaS & SaaS

- **Platform:** layer to provide to upper layers a set of services and components remotely available

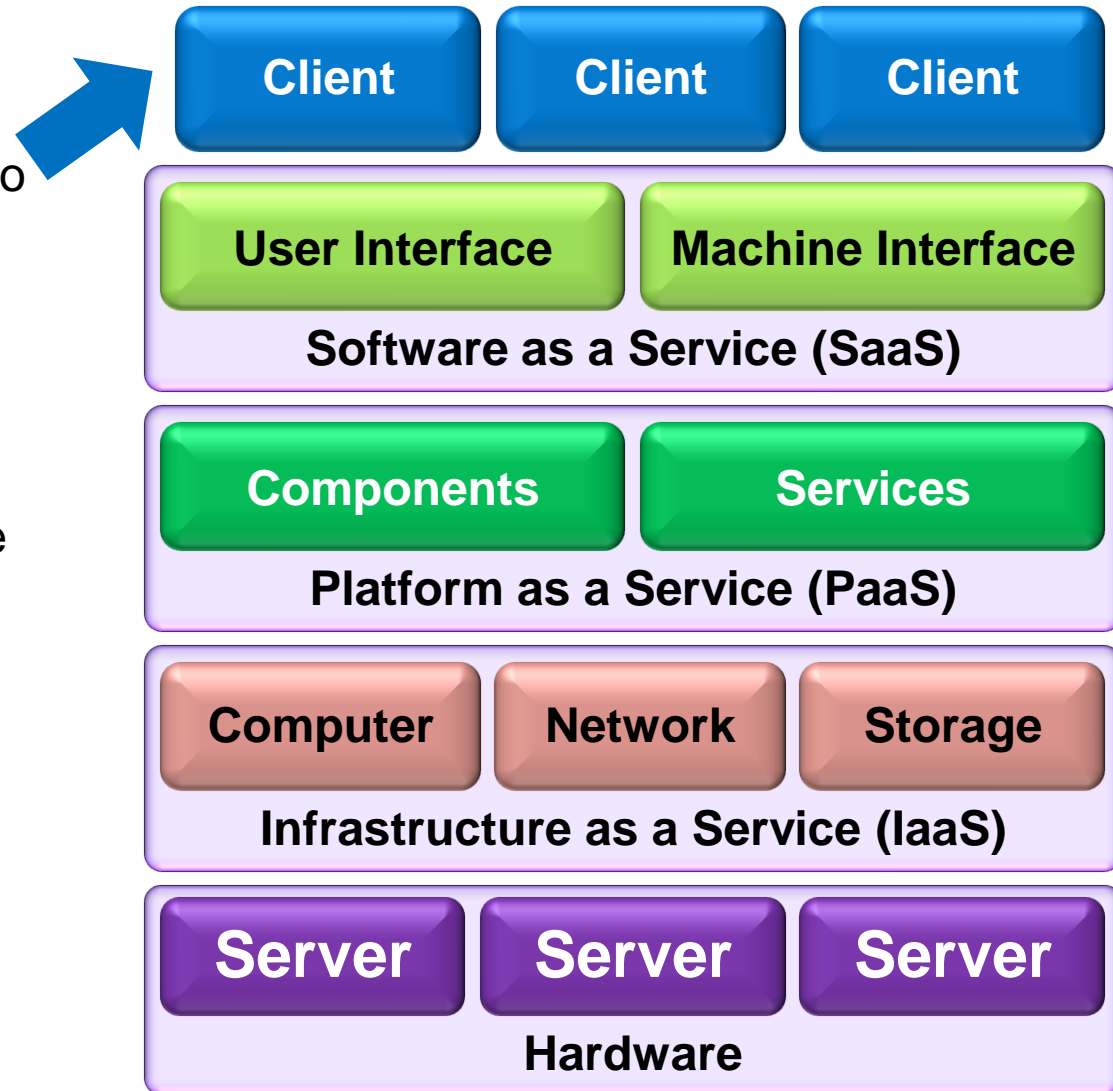

Layered Architecture: IaaS, PaaS & SaaS

- **Application:** layer to install applications, to be available via Web and Internet via Cloud

Layered Architecture: IaaS, PaaS & SaaS

- **Client** software to get access to the system.
Those applications execute on the **client physical platforms** (remote computers) owned by the final remote user
they can communicate with the Cloud via the **available interfaces**

Layered Architecture: Actors

ivellit
attori

Some SaaS and aaS examples

SaaS

From desktop applications: **Google Apps** (Gmail, Google calendar & docs), **Microsoft Window live** (Hotmail, Messenger, ...) to search engines, Google, Yahoo, Several **social networks** (Facebook, LinkedIn, Twitter, ...)

PaaS typically accessed via Web service

Services available internally to and interacting with other applications, as **Google Maps**

IaaS some experimental infrastructures

Several examples, with virtualization services, **Amazon Web Services** (S3), **Elastic Computing Cloud** (EC2), to several management and monitoring desktops to control execution (Sun global desktop, Zimdesk, ...)

Cloud different from ...

▪ **Grid Computing**

- A cloud is more than a **collection of computer resources** because a cloud provides a mechanism to manage those resources
 - Provisioning, change requests, workload balancing, monitoring
- Cloud computing is an infrastructure that sits on top of a data centre for efficiency

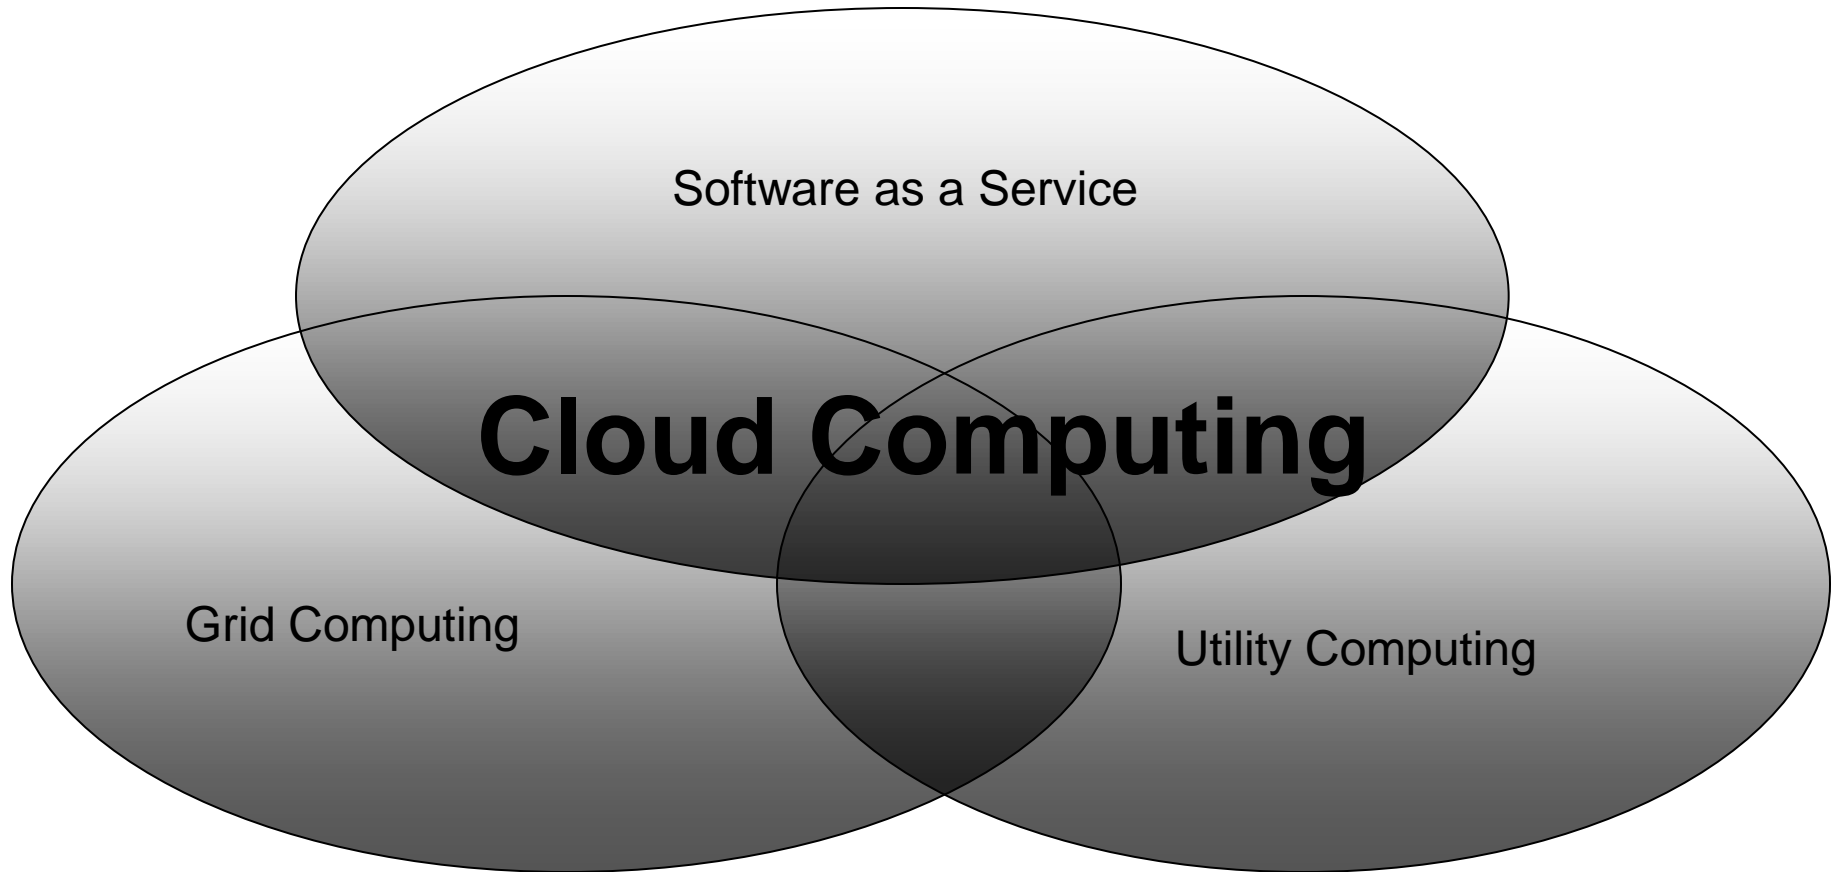

▪ **Utility Computing**

- Service that allows users to **deploy, manage, and scale** online services using the provider's resources and pay for resources they consume
- Users want to be in control of what runs on each server
- **Cloud users** want to avoid infrastructure. The provider is in complete control.

▪ **SaaS**

- Software that is **owned, delivered, and managed remotely** by one or more providers
- Software that allows a sharing of application processing and storage resources in a one-to-many environment on a pay-for-use basis, or as a subscription

Cloud Computing

Cloud Key Goals

Infrastructure Perspective

- How can we provide flexible compute resources quickly to promote **rapid prototyping**?
- How do we deploy applications that **scale up** to meet increasing demands over time?
- How do we manage 100,000's of machines with **minimal human intervention**?
- How can we make the most **efficient** use of all the compute resources in a data center?

Cloud Deployment Models

Typically three models

■ Private cloud

- enterprise owned or leased

■ Community cloud

- shared infrastructure for specific community

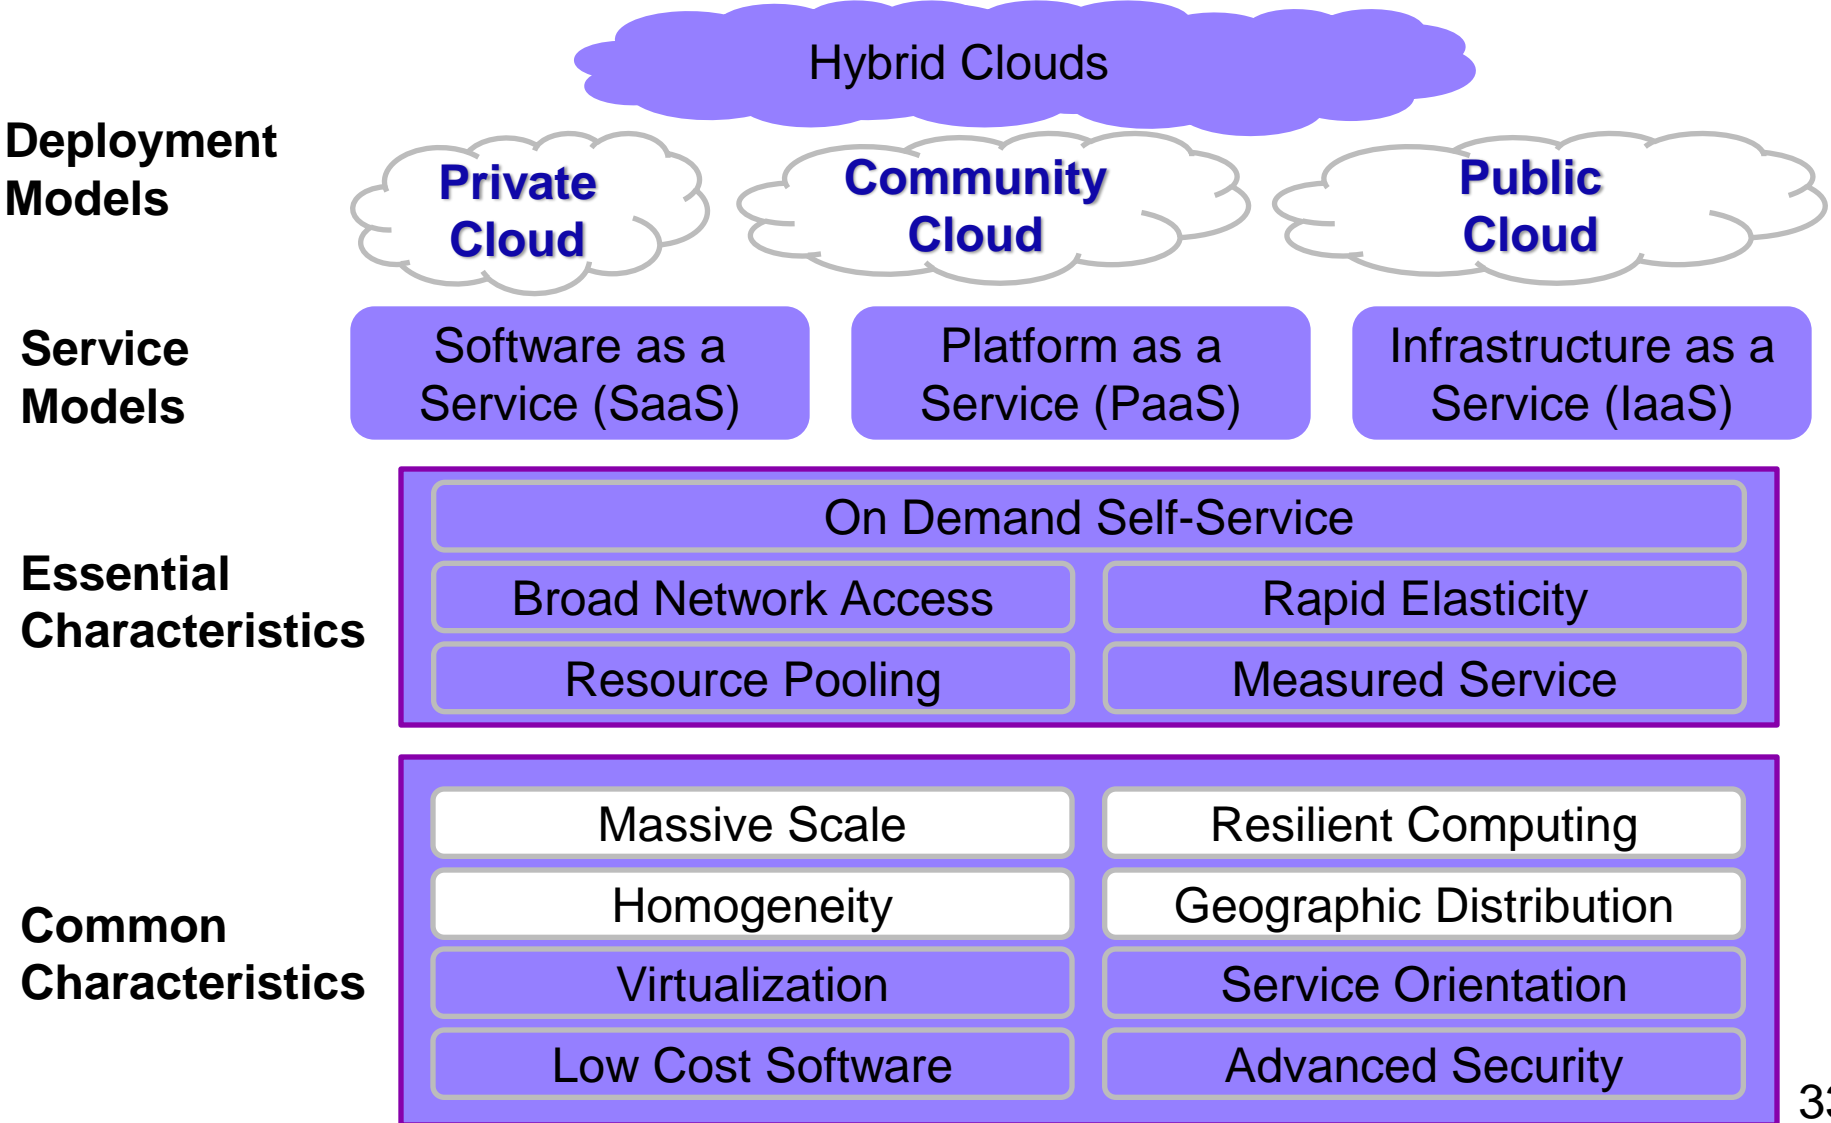

■ Public cloud

- sold to the public, mega-scale infrastructure

■ Hybrid cloud

- composition of two or more clouds

The NIST Cloud Definition Framework

Cloud components

Cloud Computing software systems have a typical **structure based on components** that can communicate with each other via well defined **interfaces** (often Web Services)

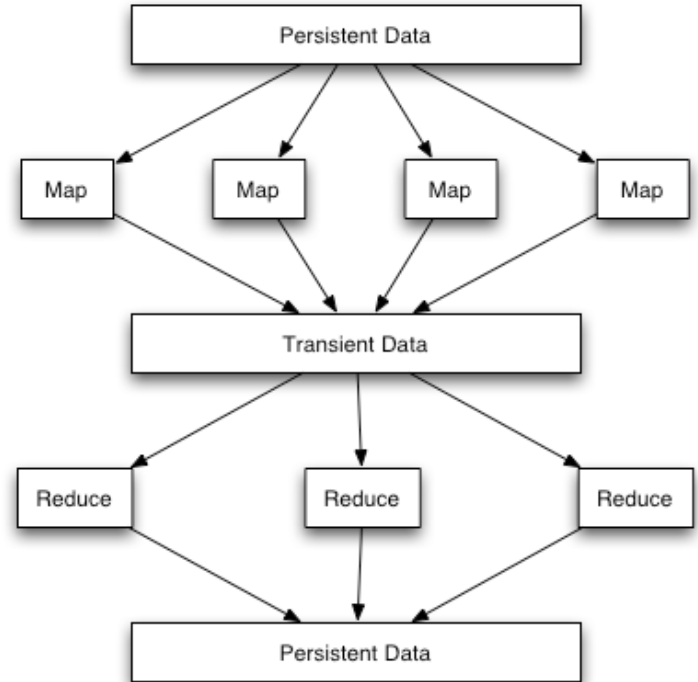

- **Four main components:**

- one **Cloud platform**, with an externally available **interface accessed via web** to cooperate with the real or virtual internal infrastructure
- one **virtualization infrastructure** and the management system for the control, monitoring, and billing for **client requests**
- one internal **memory system typically via a database**
- one internal **manager** to handle **external requests** (management, queuing, and controlling)

MapReduce Programming Model

Hadoop

- **Functional programming** that is easily parallelizable
- **Split into two phases:**
 - Map – Perform custom function on all items in an array
 - Reduce – Collate map results using custom function
- **Scales well** – computation separated from processing dataflow
- **Illustrative example:**
 - Map that squares the value of numbers in an array
 $\{1, 2, 3, 4\} \rightarrow \{1, 4, 9, 16\}$
 - Reduce that sums the squares : 30

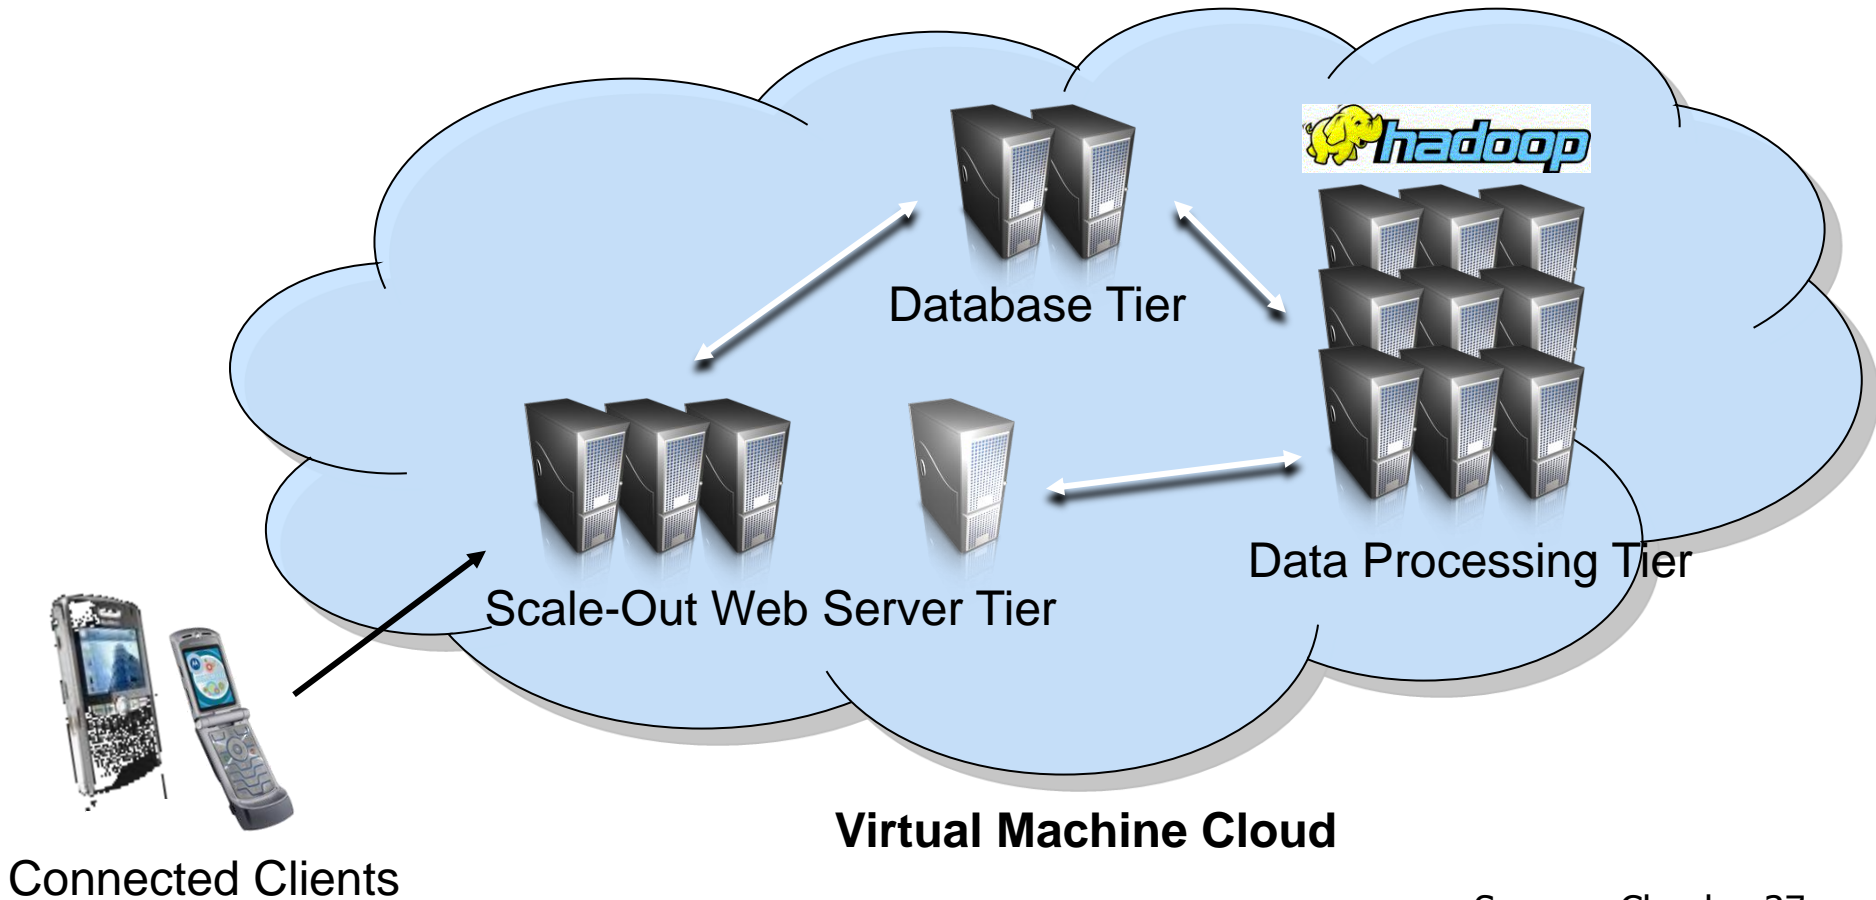

Apache Hadoop

- Open source **MapReduce** software platform
- **Automatically provides a framework** for developing MapReduce applications
 - Handling mapping and reducing logistics
 - Programmer provisioning of custom functionality
- Currently takes custom functionality in Java and Python
- IBM developed open source Eclipse plug-in to interface with Hadoop

From the Scale-Out Model to Cloud Computing ... pervasive

Cloud computing: reality check

- **Amazon Elastic Computing – EC2**: virtualized images (DB+Software and middleware+OS), Xen, simple SLA console
- **Google App Engine** (Software as a Service, web applications, Google App Engine, sandbox for management and security)
- **IBM Blue Cloud**: virtualized images (DB+Software and middleware+OS), Xen, Tivoli (monitoring and management), simple SLA console
- **HP/Yahoo/Intel Test Bed**: virtualized images, Xen, simple SLA console
- **Microsoft Azure**: recently launched by Microsoft
- **Research initiatives** (*RESERVOIR EU FP7 project*, previous projects on grid computing such as EEGE, ...)

Others ongoing projects: **Eucalyptus**, **3Tera**, ...

Google App Engine

- **Web Application on Google's infrastructures**

- **Application Environment**

- Sandbox: **secure environment** that distributes **web requests for the application across multiple servers** and starts/stops servers to meet traffic demands
- Python runtime environment
- Datastore service
- Google Accounts Integration

- **Preview period**, only free accounts are available

- 500 MB and up to 5 million page views a month
- Up to 3 applications
- Scalable quotas

- **What you need is**

- **Google App Engine SDK**
- **Google Account**
- Text Editor

Amazon EC2

■ Features

- AMI Amazon Machine Image
 - Use pre-configured, templated images to get up and running immediately.
 - Create image containing applications, libraries, data and associated configuration settings
 - Restriction: Linux-based Images
- Amazon S3 (Simple Storage Service)
 - Providing safe (?), reliable (?) and fast (?) repository to store the AMIs
- Amazon EC2 (Elastic Computing Cloud)
 - Web service that lets the user requisition AMIs

■ Price

- Pay only for the resources that are used
 - Different SLAs
 - Small, Large, Extra Instances
 - Data Transfer Levels
 - Different prices
- SLAs example
 - Small Instance
 - \$0,10 per instance-hour
 - 1.7 GB of memory
 - 1 EC2 Compute Unit
 - 160 GB of instance storage
 - 32-bit platform

Amazon EC2

- How does it work?
 - Subscribe account
 - Get Firefox Plug-In
 - Run your image
 - Example
 - Fedora Core 4
 - Apache
 - MySQL
 - Manage it

A screenshot of the Amazon EC2 Firefox UI. The browser window title is "EC2 Firefox UI - Mozilla Firefox". The address bar shows "chrome://ec2ui/...". There is a "Sign Up For Amazon EC2" button. The main content area is divided into two sections: "Available AMIs" and "Your Instances".

3Tera

Architecture intended to provide an **open framework to** allow the **development of a cloud computing environment** that's rigorous enough to take both web or enterprise application

- Configuration options
- Architecture

Resource	Min	Max
CPU's	2	1024
RAM, GB	2	2048
Storage, GB*	750	512,000
IP addresses	32	1024

3Tera

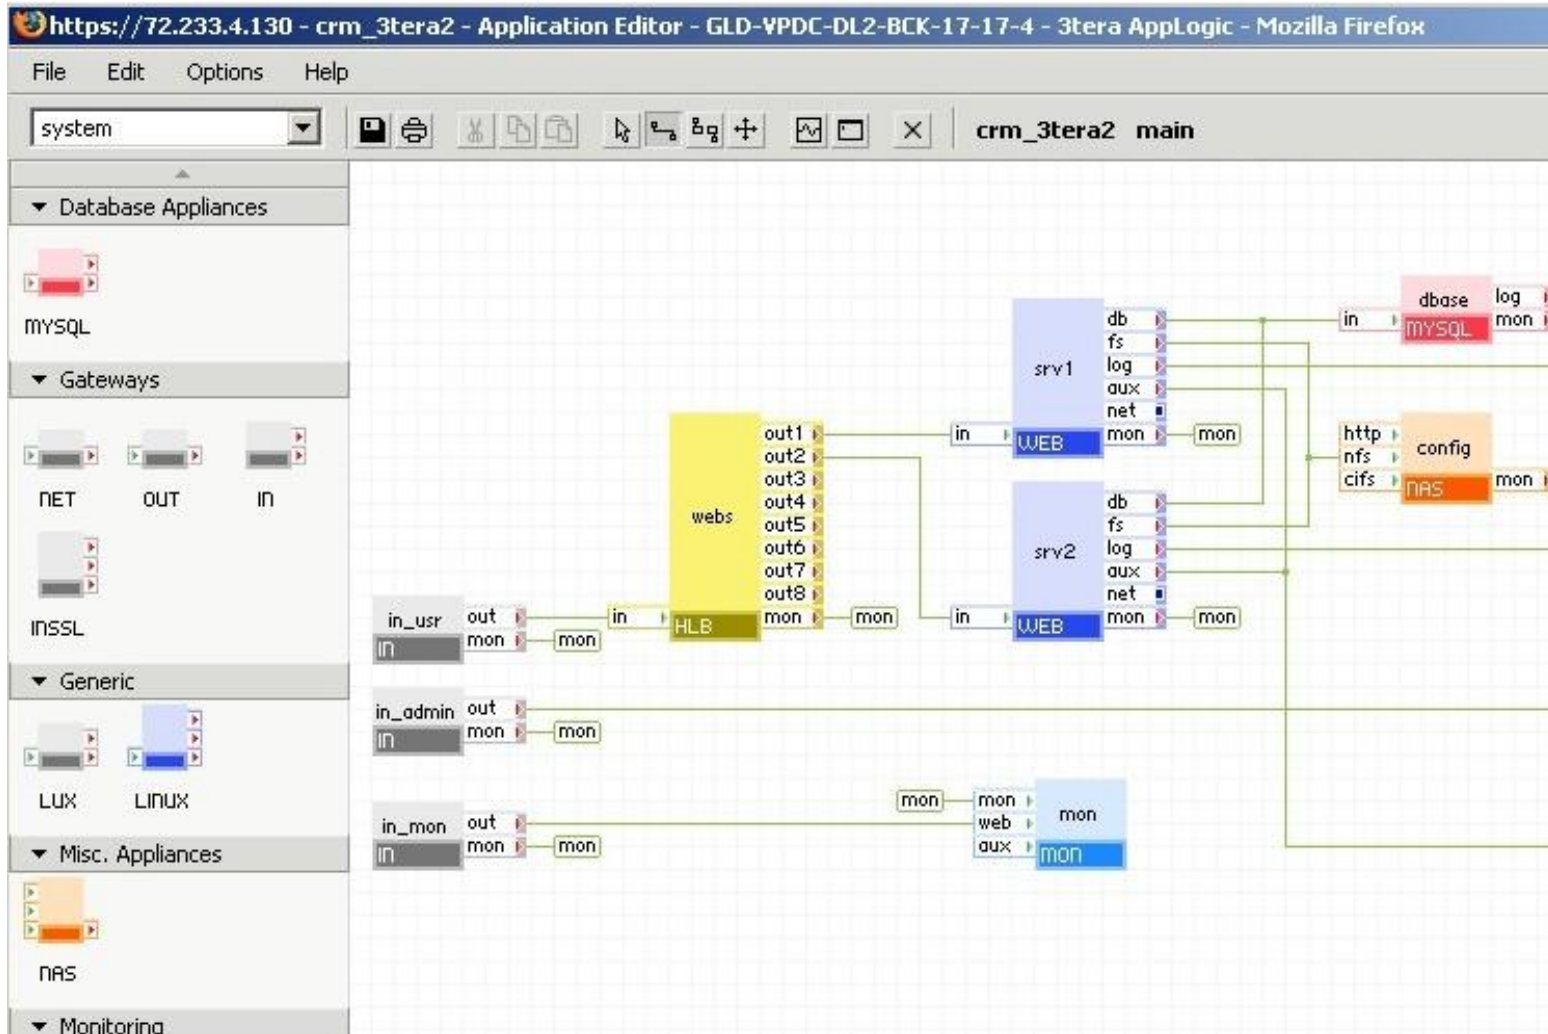

The screenshot shows a web browser window titled "mygrid2 - 3Tera AppLogic - Mozilla Firefox". The browser's address bar and menu bar are visible. The page content includes a navigation bar with "Dashboard", "Applications", and "Support" tabs, and the AppLogic logo. The main content area is titled "mygrid2" and contains several sections:

- Status**: A summary of system metrics.
 - Account**: mygrid2
 - AppLogic Version**: 2.4.2 BETA
 - System Status**: Running
 - System Uptime**: 10 days, 3 hours and 44 minutes
 - High Availability**: ok
 - Applications**: 2 running
 - CPU Cores**: 10.35 (8.00 free)
 - Memory**: 18.38GB total (14.73GB free)
 - Storage**: 1.89TB total (1.68TB free)
 - Bandwidth**: 3.91Gbps total (3.73Gbps free)
- Grid Shell**: A button labeled "Grid Shell".
- Messages**: A section stating "There are no messages at this time".
- Account Info**: A section for account details.
- Public Network**: A table showing network configuration.

Eucalyptus

- **Open-source software infrastructure for implementing Cloud computing on clusters**
- Linux systems
- Xen (versions 3.*) for virtualization
- Rocks based (open-source cluster manager)
- Virtual Machines Provisioning

Eucalyptus

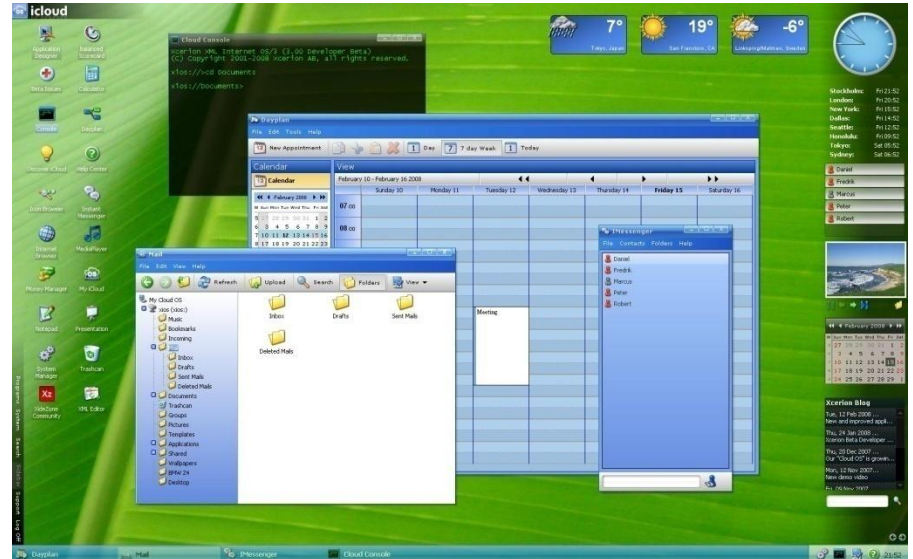

■ Eucalyptus Features (1.2 and 1.3)

- Installation
 - Rocks-based "almost-one-button" binary install
 - Experts-only "you-are-on-your-own" source install
 - RPM packages for "non-Rocks" RPM based systems
- Administration
 - Adding/approving/disabling/deleting users (via the Web interface)
 - Adding/listing/disabling images (Web interface with command line use)
 - Adding/deleting nodes and clusters (via edit of configuration files)
- Amazon's EC2 compatibility:
 - In terms of command-line tools

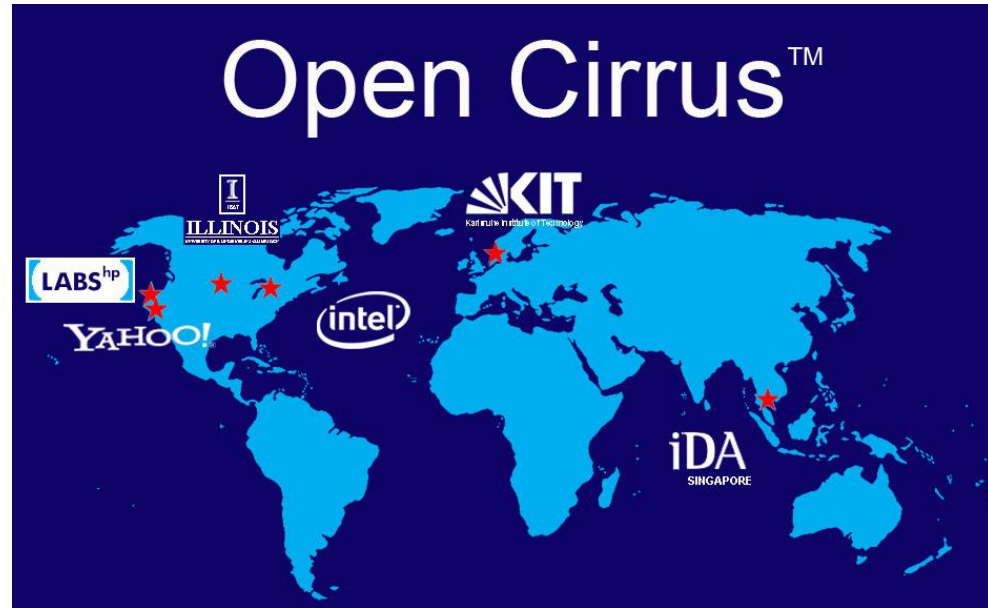

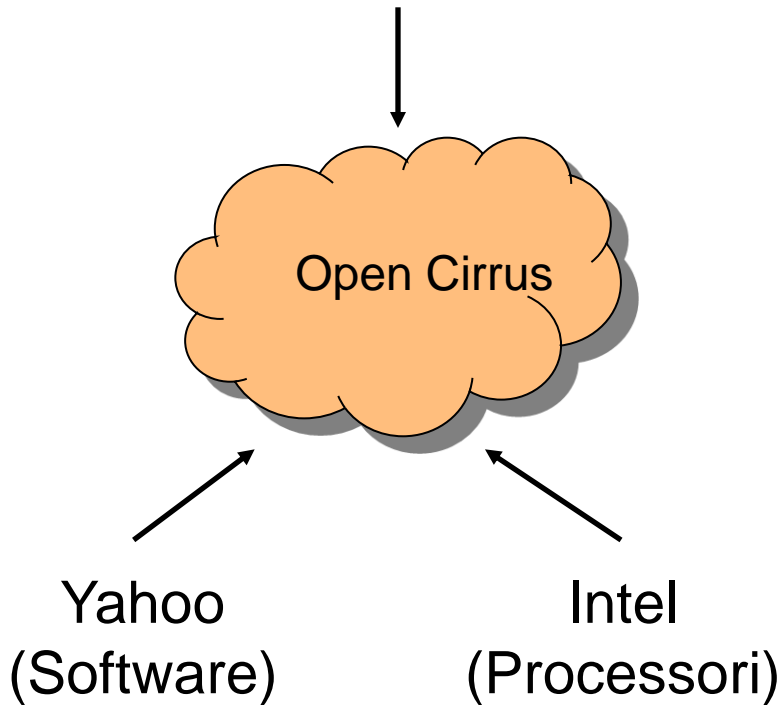

Xcerion

-  **icloud** is an Internet service providing a virtual desktop and OS for free
- Technology
 - XIOS/3 XML Internet Operating System
 - XML Virtual Machine executes the applications locally instead of in the cloud
 - Cloud used for data persistence, storing the users files

Yahoo / Intel / HP test bed

HP (Server e Dispositivi)

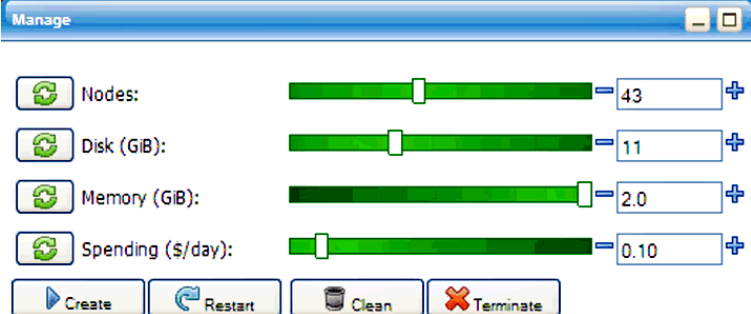

- HP Labs(USA)
- Intel Research (USA)
- Yahoo (USA)
- University of Illinois (USA)
- Karlsruhe institute of Technology (Germany)
- Infocomm Development Authority (Singapore)

Open Cirrus: a Cloud testbed

Merging of various efforts (even research)

- **Goal:** develop an **open-source stack** and **API for Cloud**
- Geographically distributed and **federated** testbed (no centralized management)
- Common services: **Global Single Sign-on, Hadoop, Hadoop Distributed File System (HDFS)**
- **Other services:** cluster management, application framework (Pig, MPI, ...)
- **System vs. application-only:** physical computers (not only virtual machines)
- Validation via heterogeneity

Status Configuration Theme Monitor Hadoop Jobs

IBM Blue Cloud

- “**self-service**” model for the requested and managed computational resources
- **automatic image-based provisioning of Xen VMs** (Virtual machinesTivoli)
- **completely automatic** real-time **monitoring** (Tivoli)
- big pool management of **virtual shared resources**
- plug-and-play for the **Xen hosting platform**: auto discovery & configuration (Tivoli)
- **automatic** and **easily configurable software provisioning** (console for simple SLA)
 - WebSphere Application Server Network Deployment
 - DB2 Enterprise Server Edition
 - PHP, MySQL, IIS, MS SQL Server ...

Basic Cloud Computing Architecture

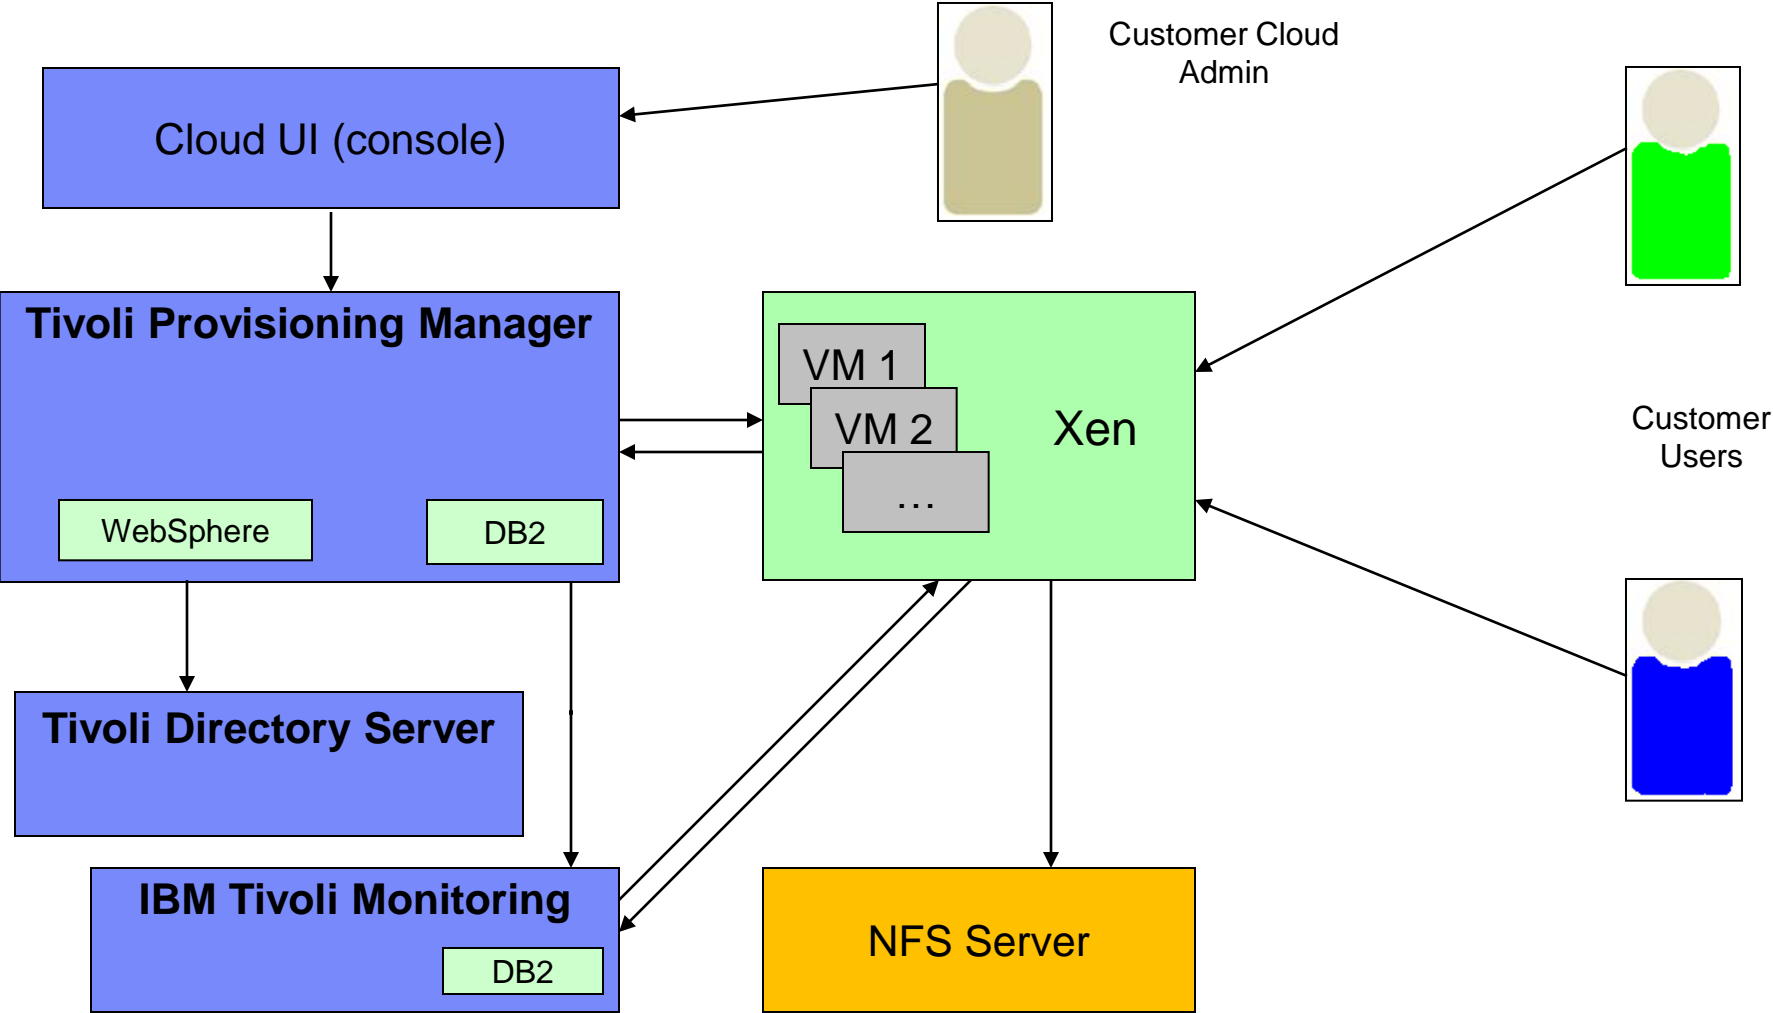

Virtualization: all physical machines act as virtual machine hosts; all workloads run on virtual machines

Provisioning: dispense preloaded virtual machines in a few minutes

Monitoring: ensure that systems that go down are recycled quickly

IBM Cloud: architettura di base

Our experience with the cloud

We are working with the **IBM Cloud Computing Center** at Dublin

- Virtual machine (VM) consolidation for power-saving
- Pervasive computing environment with a high number of VMs, e.g., one proxy-VM for each node...

Our experience with the cloud: some preliminary results

VMs Performance

Physical Server Power Consumption

Cloud computing should be...

■ Main requirements

- **Scalability on demand** (elastic and highly virtualized resources/images, Service Level Agreements – SLA, ...)
- **Automated provisioning and ease-of-use** (utility computing + infrastructure, platform, and software as a service)
- **Cost efficiency** (minimized startup costs, energy-saving,...)

■ Challenges

- **Management** (system resources, **power-saving**, ...)
- **Interoperability and portability** (data, applications, and virtualized images)
- **Metering and monitoring** (dynamic monitoring of used resources, accounting, ...)
- **Security**

Cloud for everything

Not exactly
for everything 😊

The fog has gone...

... and **clouds**
are disclosed
into the **sky!**

*Thanks for
your
attention!*
